Futurotextiles is a pioneering exhibition initiated in France in 2006 by lille3000. It associates sciences, technology, design, fashion and art through the central theme of innovative textiles in fields as diverse as clothing, transport, sports, housing, architecture, geotextiles, medicine, wellness and protection.

More than 640,000 visitors have already discovered Futurotextiles worldwide in the cities of Lille, Istanbul, Bangkok, Prato, Barcelona, Shanghai, Paris and Bucharest.

The originality of this exhibition lies in an unusual association of the art of design and highly technical industrial products. Constantly updated, Futurotextiles is now its 3rd edition.

This prototype exhibition invites the visitor to discover the world of textiles and to take in its incredible diversity, which ranges from fibre weave and knitwear to composites and nonwovens. The aim is also to show that today textiles are becoming technical, innovative and intelligent.

It embarks visitors on an artistic journey that is both playful and poetic and one of whose recurring themes is ultra-lightness. Incredible materials, microencapsulated lace and magic textiles are at the heart of the exhibition. You will be able to juggle clouds, discover unusual fabrics (derived from coffee, basalt or milk casein), or stroll among incredible inventions and surprising objects from France, Europe and Argentina.

** Tecnópolis is a science park located in the outskirts of Buenos Aires dedicated to science, technology and art. It offers visitors the opportunity to discover highly varied scientific fields, namely nanotechnology, biodiversity, health, sports, digital design, renewable energy, space research and so on.*

In 2013, for its 3rd edition, more than 4 million people visited Tecnópolis during its 90-day run.

This year, for the first time, Tecnópolis will host a pavilion dedicated to the field of textiles with the Futurotextiles exhibition, in connection with the FIBRAS event in September 2014.
